

CARABINER WITH AN ILLUMINATOR

ABSTRACT OF THE DISCLOSURE

The carabiner with an illuminator mainly is provided in a main body of the carabiner with a receiving chamber to receive sequentially therein
5 an elastic element, a pushing member and an illuminating set. A rotating member is provided on the opening of the receiving chamber, when the rotating member on the opening is rotated, it makes different displacement of the illuminating set in the receiving chamber in pursuance of the depth of screwing up onto the opening. By pressing of
10 the pushing member on the illuminating set, the illuminating set can get the effect of connecting or breaking of an electric circuit, thereby turning on/off of the illuminating set can be controlled, and thus an effect of illumination of the main body of the carabiner can be attained.
